

General instructions

Immediately find a partner to work with!

You must work in groups of two. Both members must actively participate in solving every problem. Only in exceptional circumstances do we accept anything else than two people working together, and such cases must be agreed with us. **Your assignment will not be graded if you do not follow the above rule!**

First try to find a partner yourself!

If you cannot find a group member yourself, send a mail to Ashkan Panahi (ashkan.panahi at chalmers.se) with the subject "Group partner request".

Ashkan will then try to match you with another person as soon as possible. In the meantime, start to think about the problems yourself.

Module structure

The normal structure of a module is the following:

- Introductory lecture in the beginning of the week. You can start working with the module already before the lecture.
- Module work during the week. The module assignment is normally handed in on Tuesday. Consulting times will be available where students can meet TAs during the week.
- Follow-up lecture the following week. This lecture will provide feedback on the problems and additional topics related to the module. **Attend this lecture ONLY if you have handed in your answers to the module! (it doesn't have to be marked - just submitted)**
- The last module of the course is your own min-project and does not have any lecture. You need to submit a short proposal first and it has to be approved before working on your mini project.

How to work with the problems

The tasks of a module can be of different kinds such as:

- summary of the written material or lectures
- exercises and implementation tasks based on what you have learned

- open problem solving tasks and discussions

The open problem solving tasks are intended to practice your ability to reach as far as possible with your own thinking. To proceed, you will need to clarify by making your own assumptions, investigate, try things out, and yourself decide when you are satisfied with the solution. It is normal that such problems are difficult to understand and interpret, and they may not always have a single right answer. For such problems you may not search for answers in books, on the Web or anywhere else, unless specifically indicated in the problem. On the other hand, we fully accept that you may not be able to solve such a problem completely. Even if you don't, you will develop your skills by trying.

Time management is very important, and you must control how much time you spend on each problem. Officially, you have 20 hours per person per week (assignment and lectures), and we do not require of you to work more than that. Do not spend time on unnecessarily long answers - short and clear answers are usually best and handwritten formulas and figures are fine.

Being careful saves time and is important for successfully solving difficult problems. To routinely check things is a simple way to reduce errors and increase quality. By reflecting on your errors you can also teach yourself to avoid errors in the first place.

The pedagogy of this course is based on trust. We consider it as a serious breach of the rules to hand in answers that are not entirely your own. If you run into trouble, come and talk to us and we will consider reasonable ways to help.

Module passing requirements

The course is designed so that you should not need to worry about passing if you have the right background and do the submissions in time with the expected effort.

The module assignment will pass if:

- Your answers or solutions are of adequate quality. For open problem solving tasks, we pass if you have made a best effort to understand and solve the task within the allocated time.
- You have answered, or attempted to answer, every part of every compulsory question.
- Your solutions or partial solutions are clear, readable and laid out in a logical order.
- You have submitted in time (possibly in special prior agreement with a teacher).

For each assignment the main feedback is through the follow-up lecture, where you can compare your solutions with the ones we suggest. If you need additional individual feedback you are welcome to contact us during supervision hours or by email.

One return

You are allowed at most one return for each module. If you fail to pass the updated submission within the time set by the teacher, you will not be able to pass this instance of the course. If a module has failed in this way you cannot submit or receive supervision on subsequent modules.
